Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues on page 5 second paragraph, "applicant's claim limitation at question is indicating a stream path type of various sub stream paths." While applicant's point is understood. Examiner respectfully disagrees. [The specs teach on page 3 paragraphs 3rd and 4th. Multiple stream paths may exist on the global time axis of the playlist. Any stream described by a playitem or a subplayitem may be an elementary or again a multiplex of streams]. Yamada teaches on (column 7 lines 62-65) the AV attribute table for menu (604) includes a number of the video streams or audio streams to be used in the menu, and an attribute of the video or audio stream. Therefore, Yamada actually teaches the definition of stream path type, according to the specification. Figure 26 also shows how the subsream path type is acquired from the video file management information.

Applicant further argues on page 6 third paragraph, "there is clear evidence in Wolf that Wolf does not describe that the DVB mode and the DVD mode operate in parallel." Examiner again disagrees. Wolf teaches on (column 3 lines 1-3) decoder 20 uses three data paths in either the DVD or DVB mode of operation, namely a video data path, an audio data path, and a control path. Therefore, Wolf states the existence of two different modes of operation Digital Versatile Disk (DVD) or Digital Video Broadcast (DVB). These two modes of operation are parallel because they are completely independent from each other. The information that is manipulated by the video and audio decoder does not determine if the system is in fact parallel or not. The decoder is only used to process the video signal and display the independent mode (either DVD or DVB).
